Latent Space

The policies resulting from deep learning are represented in the form of a neural network. Our objective is to study the neural network's latent space in order to extract the semantics used for an explainability process.

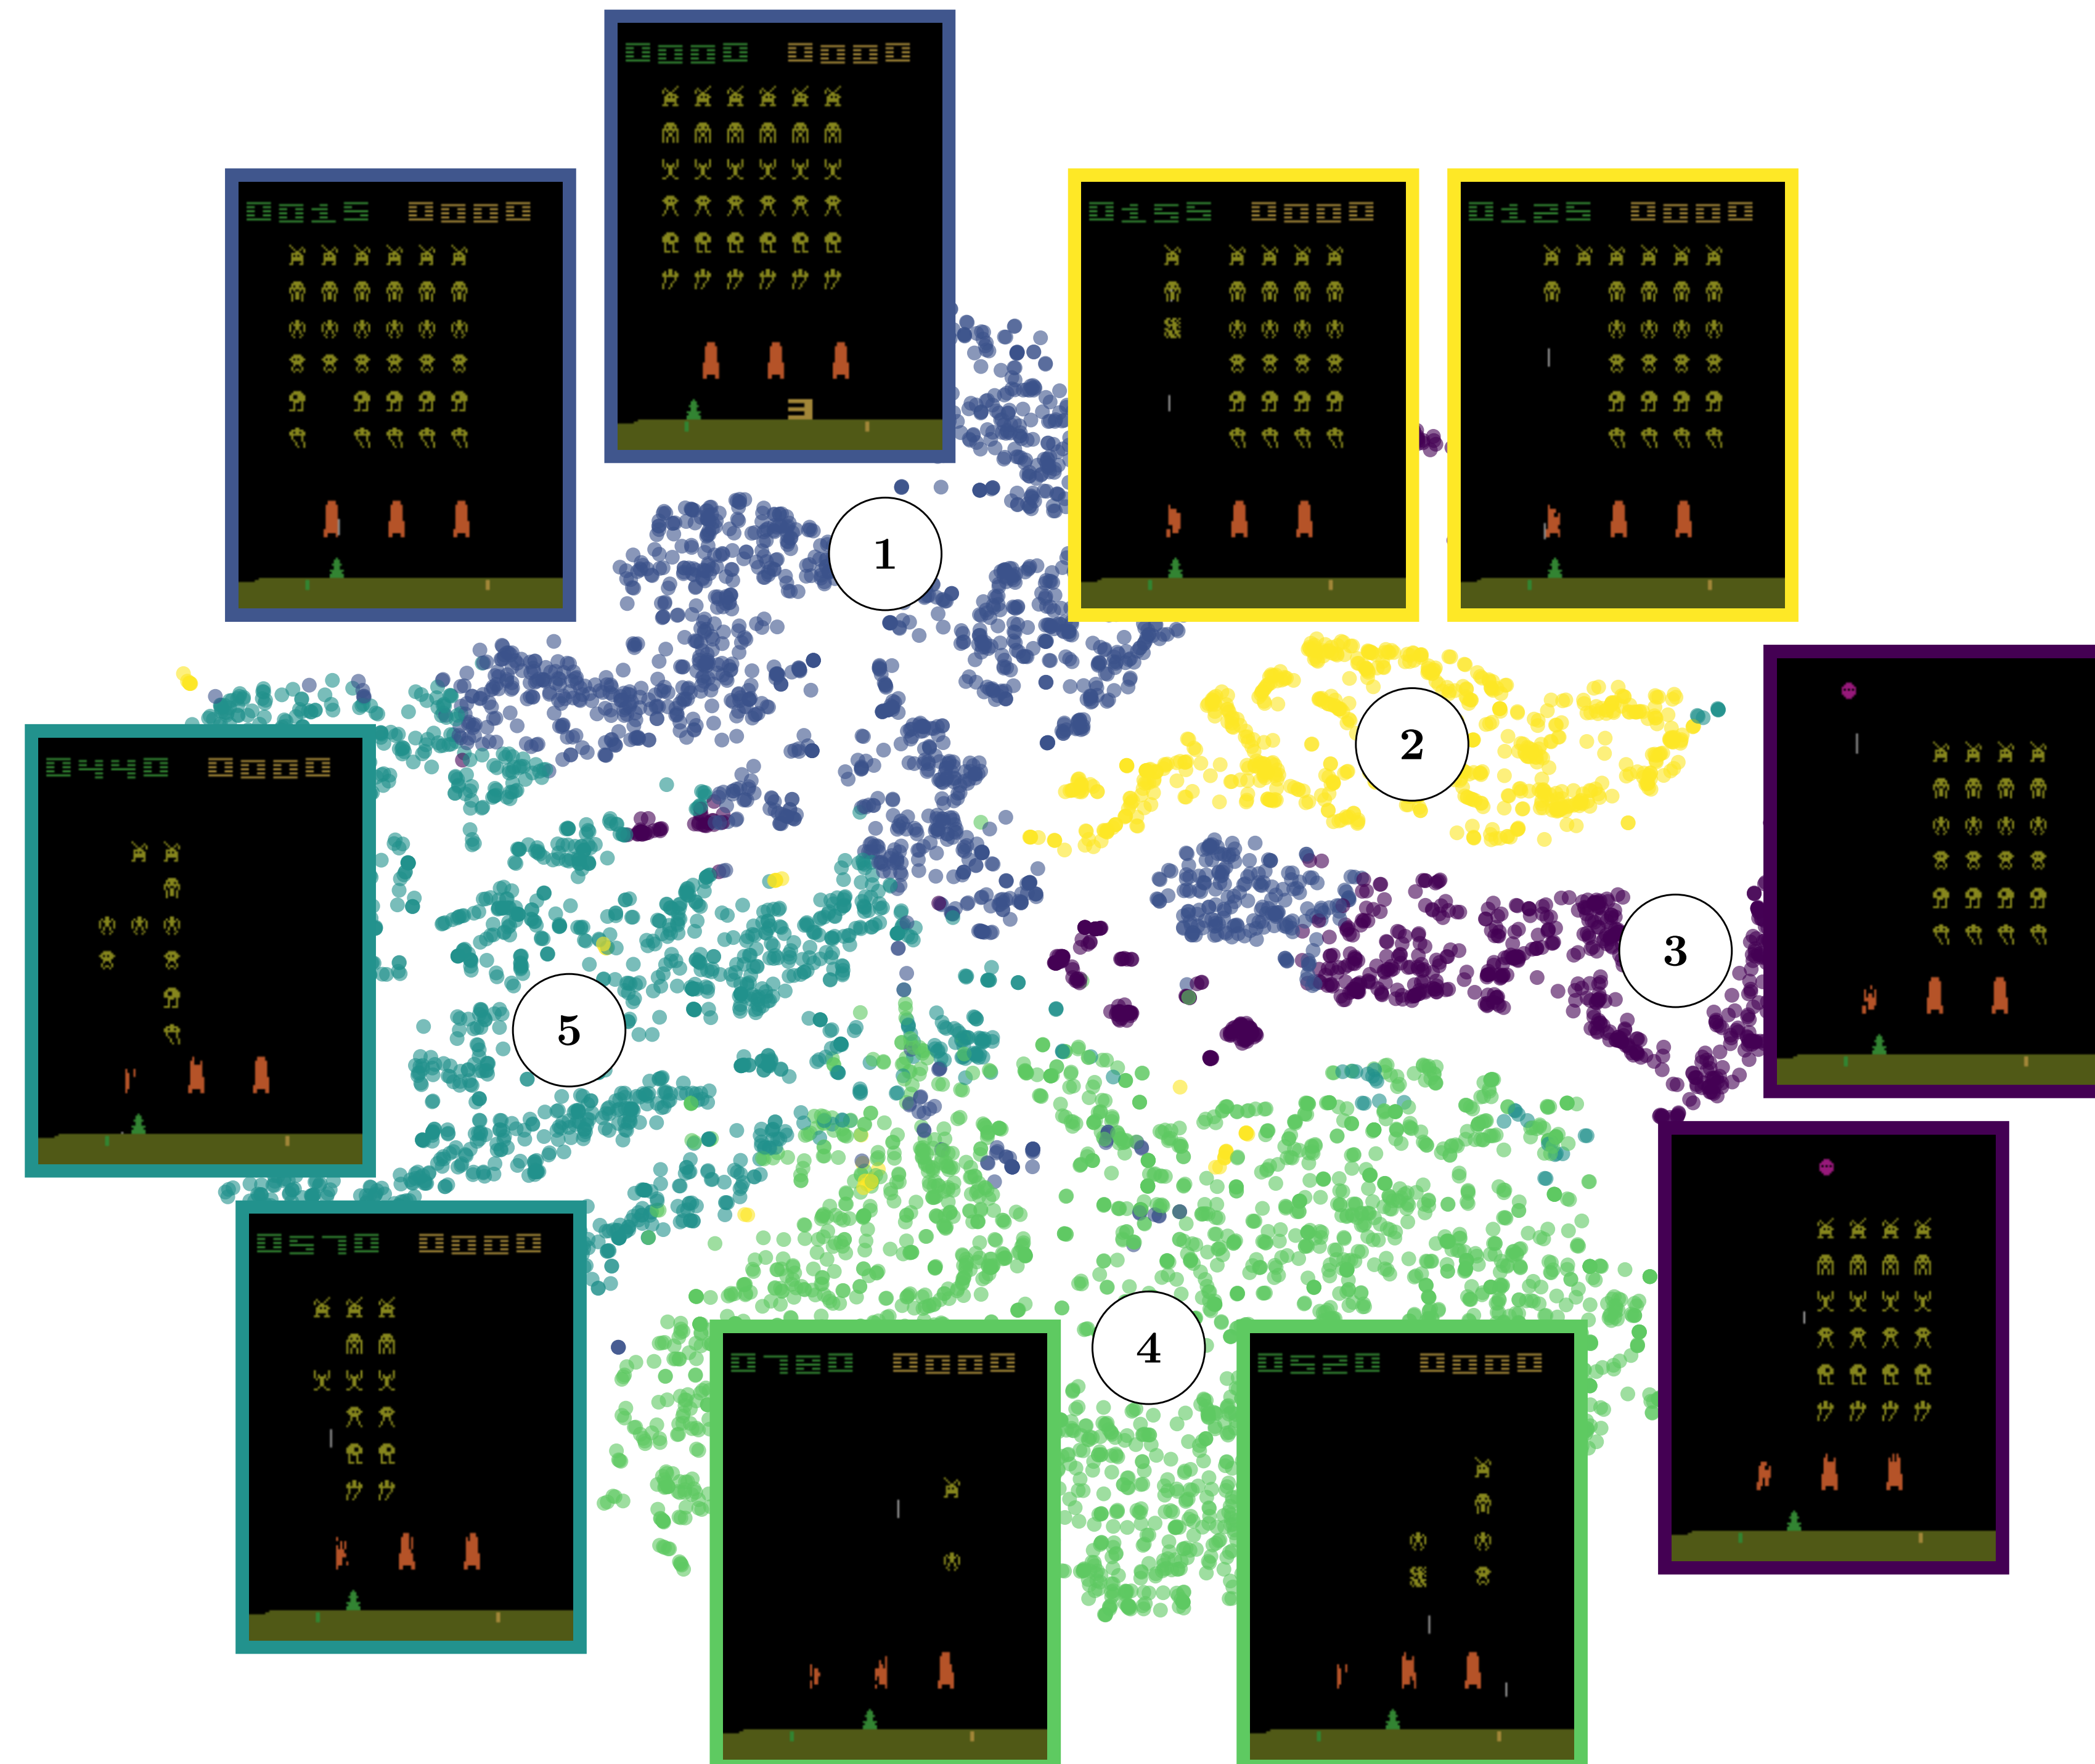

Clustering Agent Representation

The policies resulting from deep learning are represented in the form of a neural network. Our objective is to study the neural network's latent space in order to extract the semantics used for an explainability process.

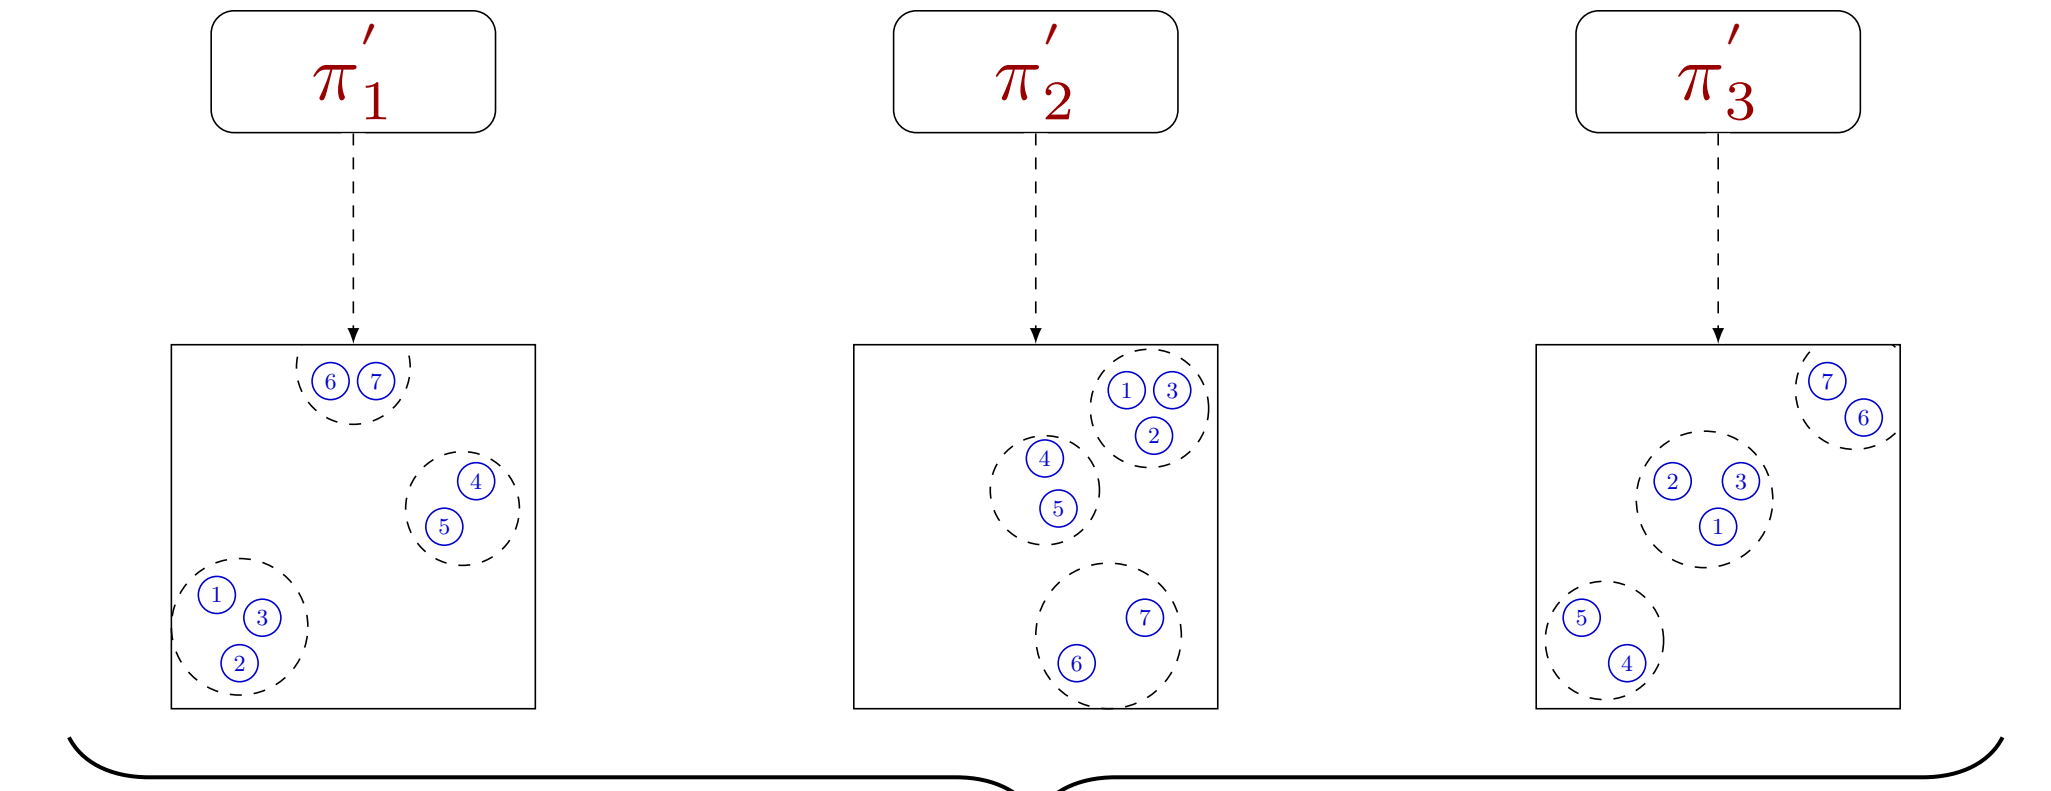

Semantic Latent Space

The policies resulting from deep learning are represented in the form of a neural network. Our objective is to study the neural network's latent space in order to extract the semantics used for an explainability process.

Clustering Universality

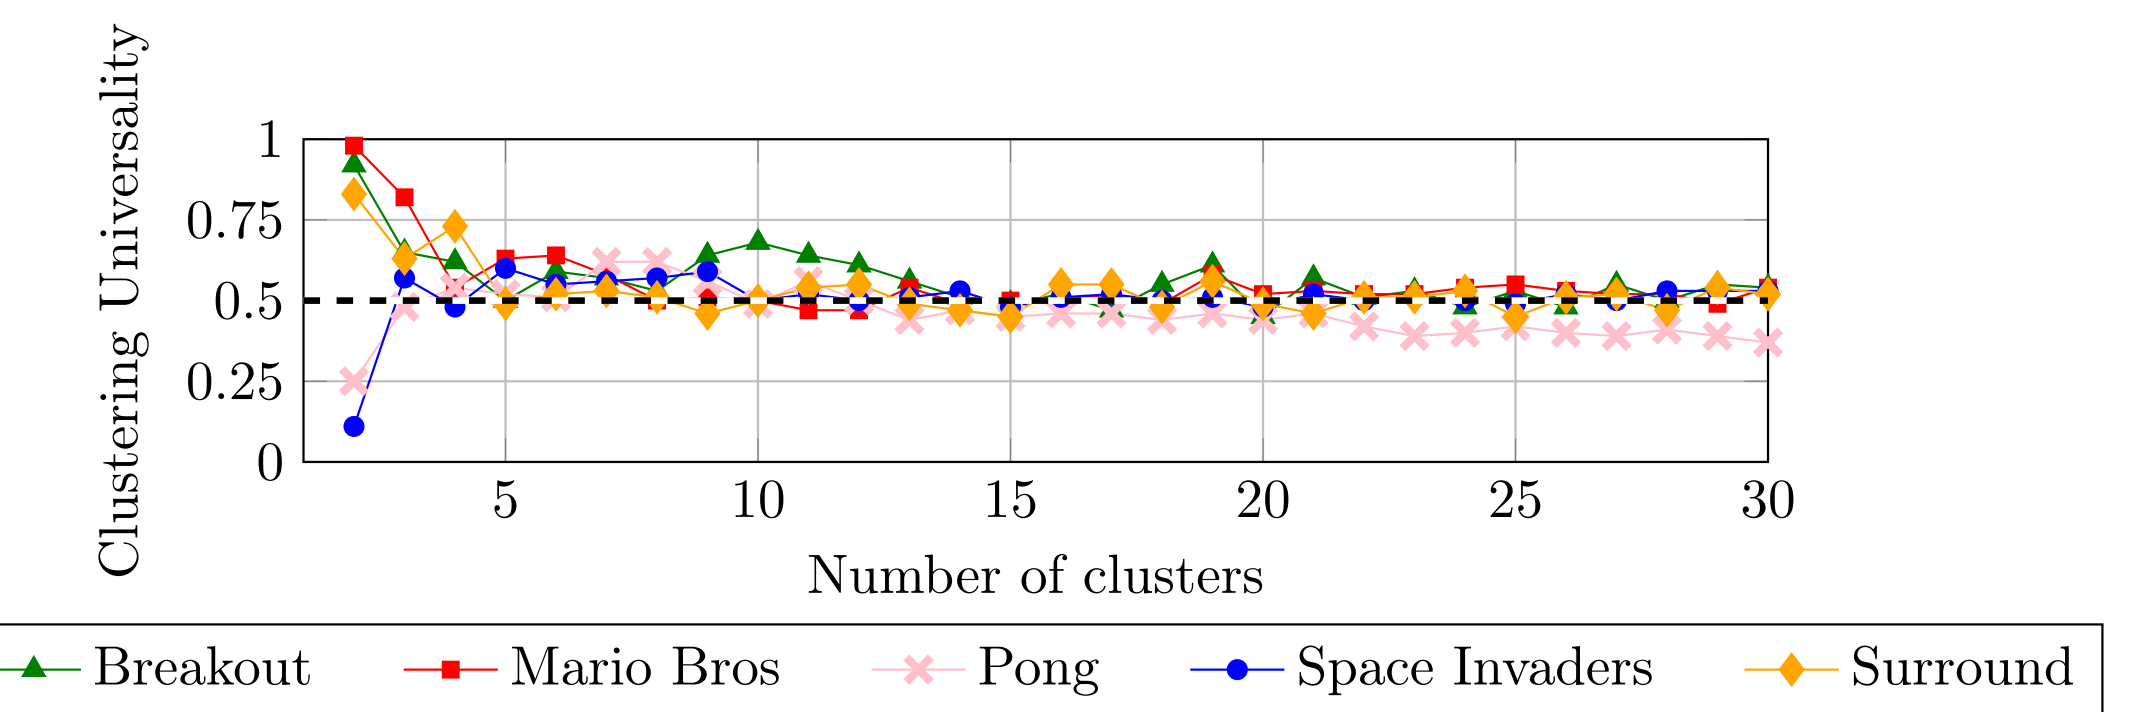

The policies resulting from deep learning are represented in the form of a neural network. Our objective is to study the neural network's latent space in order to extract the semantics used for an explainability process.

$$Clustering\ Universality = \frac{1}{\binom{n}{2}} \sum_{i=1}^n \sum_{j=0}^{i-1} ARI(C_i, C_j)$$

Evolution Clustering Universality

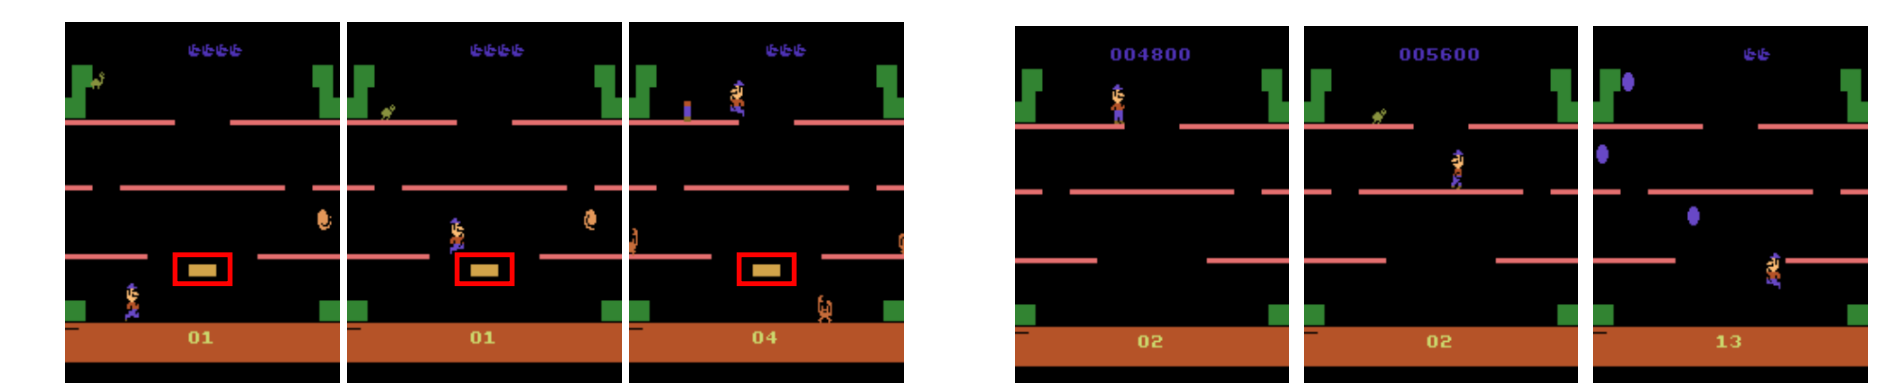

The policies resulting from deep learning are represented in the form of a neural network. Our objective is to study the neural network's latent space in order to extract the semantics used for an explainability process.

Semantic Granularity

The policies resulting from deep learning are represented in the form of a neural network. Our objective is to study the neural network's latent space in order to extract the semantics used for an explainability process.

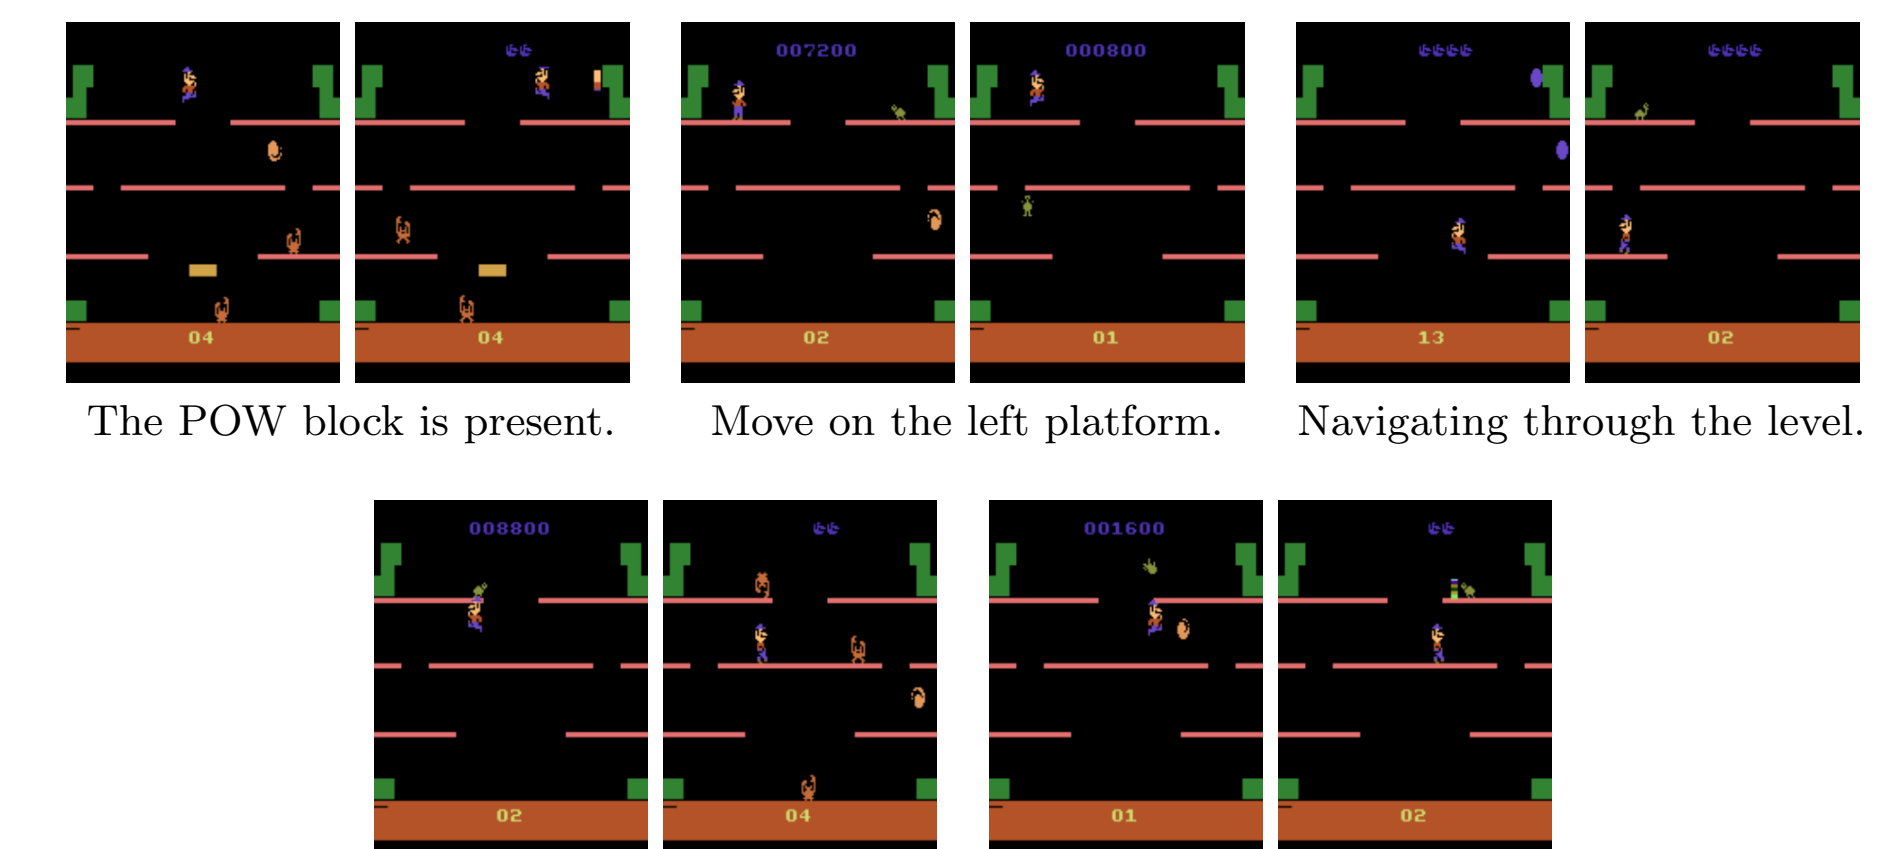

The case with 2 clusters.

The POW block is present.

The POW block is absent.

The case with 5 clusters.

The POW block is present.

Move on the left platform.

Navigating through the level.

Attacking the left.

Attacking the right.
